SUMMARY

Informatics Engineering Student with hands-on experience in full-stack web development, data analysis, and machine learning. Experienced in building web applications using React, TypeScript, Node.js, Laravel, and MySQL, alongside developing data-driven projects using Python and SQL. Interested in building scalable applications and applying data-driven approaches to solve real-world problems.

EXPERIENCE

Teaching Assistant (Lab Assistant)

Universitas Islam Nusantara (UNINUS) | June 2026 – July 2026

- Database — assisted Mr. Galih in conducting lab sessions, guiding students through SQL exercises (DDL/DML, joins, stored procedures, triggers), and evaluating practicum assignments
- Framework-Based Application Development — assisted Mr. Ikmal in guiding students through Laravel-based application development, covering CRUD, REST API, and database integration

Full Stack Developer Intern

PT Bentang Inspira Teknologi | August 2026 – Present

- Building backend services using Node.js, Express.js, and MySQL, including user registration and authentication.
- Developing a scholarship and training platform using a microservices architecture.
- Developing frontend features using React, TypeScript, and Tailwind CSS.
- Implementing secure password handling using bcrypt and token-based authentication with JWT.
- Using Git for version control and collaborating on application development and service integration.

PROJECT EXPERIENCE

LQ45 Stock Price Forecasting Using LSTM & TFT

Machine Learning | Time-Series Forecasting

- Extracted 5 years (2020–2025) of historical LQ45 stock data via yFinance API and engineered a MySQL database pipeline for structured storage, preprocessing, and feature manipulation.
- Developed and compared deep learning forecasting models using TensorFlow/Keras (LSTM) and PyTorch-Forecasting (Temporal Fusion Transformer) on Google Colab.
- Optimized TFT model to achieve a high R^2 score of 0.9695 and low MAPE of 7.45% on aggregate stock forecasting.
- Evaluated individual stock-level predictions using LSTM, achieving a stable average RMSE of 0.0373 and MAE of 0.0282 across the index.
- Utilized Scikit-Learn, Pandas, and NumPy for robust data preprocessing and scaling, and visualized actual vs. predicted market trends using Matplotlib and Seaborn.

Dota 2 Team Performance Analysis

Data Analysis & Visualization

- Extracted and processed professional match data across 7 major tournaments using Requests (OpenDota API) and Pandas to analyze team performance, meta shifts, and game dynamics.
- Engineered a custom "Mental Score" metric ($comeback\ rate - throw\ rate$) to quantify team resilience; identified Natus Vincere as the most resilient team and surfaced teams with high throw volatility.

- Developed interactive Plotly and Tableau dashboards to visualize pick vs. win rates, proving that high-popularity heroes (e.g., Jakiro, Tusk) underperformed compared to high-efficiency picks like Centaur Warrunner.
- Conducted tournament trend analysis to uncover meta shifts, discovering a match duration spike to 42 minutes in DreamLeague S28 and a steady climb in action-heavy, aggressive playstyles.

News Sentiment Analysis as IHSG Market Signal Using IndoBERT

NLP | Time-Series Analysis | Web Scraping

- Scraped 10,000+ news articles from Kompas & Tempo covering Prabowo's administration using Selenium and BeautifulSoup, building an automated multi-page scraping pipeline.
- Applied IndoBERT (Indonesian RoBERTa) for sentiment classification on news headlines, producing continuous sentiment scores across 20 months of political coverage.
- Discovered statistically significant negative correlation between news sentiment and IHSG movement ($r=-0.1195$, $p=0.0196$), strengthening to $r=-0.1545$ at 7-day lag — indicating delayed market reaction to political media coverage.
- Visualized sentiment trends, lag correlations, and source comparisons using Matplotlib and Seaborn, capturing key political events such as the Makan Bergizi Gratis program launch.

SKILLS

Languages & Databases: Python, JavaScript, TypeScript, SQL, MySQL, Excel

Web Development: React, Node.js, Express.js, Laravel, REST API, Tailwind CSS

Frameworks & Libraries: Pandas, NumPy, Scikit-Learn, TensorFlow/Keras, PyTorch-Forecasting, Hugging Face Transformers, Selenium, BeautifulSoup, Plotly, Seaborn, Matplotlib

Methodologies & Tools: Microservices Architecture, Git, Time-Series Forecasting, Deep Learning, NLP, Sentiment Analysis, Predictive Analytics, EDA, Feature Engineering, Web Scraping, Tableau, Power BI

EDUCATION

Nusantara Islamic University

Bandung, Indonesia

Informatics Engineering / GPA: 3.67/4.00

2023 – 2027

CERTIFICATIONS

[Microsoft Azure Data Fundamentals - Talenta AI Indonesia](#) | January 2024

[Python Fundamental for Data Science - DQLab](#) | January 2024
